Introduction

MARS is one of the research undertakings by the Social Wellbeing Research Centre (SWRC), Universiti Malaya (UM), to produce nationwide longitudinal data on ageing and retirement involving personal interviews of individuals aged 40 years and older in Malaysia.

MARS collects information on vital issues impacting their lives which include personal, family, health, economic and social factors. MARS is adapted from the Health and Retirement Study (HRS) in the United States carried out by the Survey Research Centre (SRC), University of Michigan. SRC provides support in the development of MARS study design, training and technical assistance prior to data collection, during and post-production of MARS data. To ensure quality data, regular monitoring of the fieldwork and random callbacks were conducted throughout the production period.

Data collection for MARS Wave 1 and Wave 2 were completed in May 2019 and April 2022, with a total sample of 5,613 and 4,821 respondents, respectively. Of the MARS Wave 2 sample, 75% consisted of panel respondents who had participated in Wave 1.

This footprint highlights the journey of MARS from its humble beginning to some of its achievements in terms of expansion of research collaborations, extended research projects, users and uses of MARS data, and dissemination of MARS findings through presentations and publications within the scientific community as well as policy makers and other stakeholders.

Gateway to Global Aging Data

The Gateway to Global Aging is a platform for population survey data on ageing around the world. The site provides access to data from 11 longitudinal studies, which is hosted by the University of Southern California's Program on Global Aging, Health, and Policy. The project's goal is to provide the resources to support cross-national research on ageing: a comprehensive digital library of survey questions, a search engine that finds concordance information across surveys, and a set of harmonised or identically defined variables for analysis. MARS is one of the studies featured in the Gateway to Global Aging Data platform.

The Gateway indexes and extensively documents study designs and survey questionnaires. So far, the Gateway has catalogued surveys from 18 studies in 45 countries from 1992 to 2020. Additionally, for many of these surveys, the Gateway also creates and releases harmonised datafiles which are comprised of variables representing a subset of the original survey data and have been defined to be as comparable as possible across different studies. The Gateway is funded by the National Institute on Aging and all data and documentation are available to researchers without cost.

GATEWAY TO
GLOBAL
AGING
DATA

Objectives of MARS

To produce a comprehensive baseline data on the individual, family, social, economic and health of middle-aged and older persons.

To collect longitudinal data on life histories and experiences of middle-aged and older persons over time to gain a deeper understanding of the issues and challenges related to retirement and ageing.

To offer evidence-based recommendations on opportunities and policies, to address the trends that emerge in the midst of population ageing in Malaysia.

To be part of the global platform on retirement and ageing research, comparable with similar longitudinal surveys that can provide the basis for policymaking and academic studies.

Methodology

Selection of sample was done by the Department of Statistics Malaysia (DOSM) based on the 2010 Population and Housing Census using a multi-stage sampling procedure. Each state was stratified by urban and rural enumeration blocks (EBs) followed by the selection of EBs in each stratum, selection of living quarters or households in selected EBs, and selection of members in the selected households.

A maximum of three members aged 40 or older were selected as possible respondents from each household based on age, willingness and ability to participate.

MARS data was collected via face-to-face computer assisted personal interview (CAPI) by trained enumerators using a structured questionnaire. Questionnaire development was guided by the Japanese Study on Aging and Retirement (JSTAR) and the Health and Retirement Survey (HRS) in the US, and modified to ensure its applicability, suitability and practicality in the local context. The questionnaire which was originally written in English was translated into Malay, Mandarin and Tamil to cater for the major ethnic groups of MARS respondents.

MARS was conducted based on the following principles and methodology:

| | | |
|---|---|---|
|  <p>Sampling framework that ensures a nationally representative sample of current and future cohorts of older people (40 years and older at a given cut-off point)</p> |  <p>Questionnaires that are internationally comparable, as they contain standard questions adopted by the Health and Retirement Survey (United States) and other family surveys</p> |  <p>Questionnaires adapted to the Malaysian context and validated through pretesting at sample sites</p> |
|  <p>The survey was conducted by qualified and trained enumerators under the guidance of experienced survey coordinators and survey management team</p> |  <p>The survey was conducted in compliance with ethical standards and privacy consent</p> |  <p>Collected data were compiled and cleaned according to specified guidelines</p> |

The comprehensive task consisted of:

- | | | | |
|-----|---|----|---------------------------------------|
| I | Designing national and regional sampling frameworks | IV | Implementing survey/data collection |
| II | Developing the survey questionnaire | V | Performing data cleaning and analysis |
| III | Training of survey enumerators | VI | Writing the survey results report |

The questionnaire includes the following nine modules:

Module 1: Family Roster and Background

Module 2: Family Support and Transfers from/to Respondents and to/from Children, Parents and Siblings

Module 3: Health, which includes Health Status, Risk Factors, Psychosocial, Physical Activity, Cognition and Health Care Utilisation

Module 4: Employment and Retirement

Module 5: Income and Expenditure

Module 6: Housing and Assets

Module 7: Social Protection

Module 8: Impact of COVID-19 (MARS Wave-2)

Module 9: Physical Measurement

MARS at a Glance

A photograph of two people's hands and arms as they work on a table. The person on the left, wearing a blue shirt and a black watch, holds a black pencil and points at a chart. The person on the right, wearing a black and white striped shirt, has their hand resting on another chart. Both charts feature various data visualizations including bar graphs, line graphs, and pie charts. The background is a solid dark blue.

Research Projects Using MARS Data

› Challenges and Opportunities of Population Aging in Asia: Improving Data and Analysis for Healthy and Productive Aging

Challenges and Opportunities of Population Aging in Asia: Improving Data and Analysis for Healthy and Productive Aging is a research project carried out by the Asian Development Bank (ADB). Through this initiative, ADB provides technical assistance and support to generate policy-relevant knowledge on population ageing by:

- supporting the development of internationally comparable survey-based panel databases on ageing in selected Asian countries; and
- coordinating comparative and demonstrative studies in selected Asian countries to provide the region's governments with information to reform health and social security policies and to craft policies to adapt to population ageing.

There are four main outputs outlined under this project:

1. To produce quality datasets on healthy and productive ageing for targeted developing member country (DMCs).
2. To promote and disseminate innovative research on healthy and productive ageing.
3. To develop a standardised and comparable cross-country evidence-based knowledge on ageing-related policy measures and assessment techniques.
4. To strengthen knowledge dissemination and capacity building on healthy and productive ageing.

› Constructing an Active Ageing Index for Malaysia

Active Ageing Index (AAI) measures the contributions of older people and the extent to which older people are empowered to participate in the economy, and the society and to live independently. Evaluation of the status of active ageing using a country specific index, namely Malaysia Active Ageing Index (MAAI) offers a robust tool to monitor societal perspective of the ageing phenomenon which is valuable for top-down policy design and appropriate for the efforts towards building public policy capacities to assess and stimulate practices of active and healthy ageing for the older population.

The AAI indicators adapted to Malaysian context is essential as living together in multigenerational households, cultural norms of extended families and receiving financial support from children in Malaysia are common practices in contrast to western countries. The adaptation of EU AAI in Malaysian context would generate a global instrument for bench marking. Hence, the study undertakes quantitative and qualitative approaches to develop MAAI as the relevant data have been scant. For the quantitative analysis, the longitudinal data collected by Malaysia Ageing and Retirement Survey (MARS) Wave 1 conducted between 2018-2019 will be used to construct MAAI in addition to other relevant databases. Meanwhile, the qualitative data will be obtained via focus group discussions or round table discussions or in-depth interviews. Promoting quality of life, social investment and empowerment of older population could be more cost-effective in the long run.

As there are various domains involved such as employment, participation in society, independent, healthy and secure living as well as capacity and enabling environment for active and healthy ageing, the index could provide insight into the area for further improvement and attention. This could lead to public policy reactions in order to generate more opportunities and providing a conducive environment for active ageing in Malaysia.

› Late Life Inactivity and Risk of Cognitive Decline: Evidence from MARS Data

Malaysia is undergoing a demographic transformation, with its elderly population set to rise significantly. As the nation ages, preserving cognitive health among older adults will be critical for individual well-being and societal stability. While policies like *Dasar Kesihatan Warga Emas Negara* promote active ageing, they neglect the crucial role of occupational and non-occupational activities in maintaining cognitive function.

This study, based on the Malaysian Ageing and Retirement Survey (MARS), highlights that cognitive decline is not inevitable but influenced by behaviours and opportunities. Engaging in cognitively demanding work, especially roles involving problem-solving and social interaction, fosters cognitive resilience. However, jobs requiring physical strain or advanced technologies may not benefit older workers. Non-occupational activities like volunteering, social interactions, and moderate exercise also enhance cognitive reserve, improving quality of life regardless of work history.

To leverage these insights, policy must act. Promoting cognitively stimulating work through flexible arrangements, retraining, and employer incentives can keep older adults economically active and mentally sharp. Supporting informal workers and caregivers with safety nets and protections is equally vital. Investing in cognitive health through engagement and comprehensive support will enable Malaysia to transform its ageing challenge into an opportunity for progress.

OUTPUT/IMPACT

A policy brief entitled “**The Role of Occupational and Non-occupational Activities in Promoting Cognitive Health in Aging Populations**” was published by SWRC in 2024.

› The Fit-for-Purpose Social Protection Policy: Targeted Those in Need

This research uses data from the Malaysia Ageing and Retirement Survey to identify and address the diverse needs of retirees aged 60 and above. Machine learning techniques cluster retirees based on shared characteristics, revealing the influence of family support, healthcare, and socio-demographic factors on their wellbeing. Policy recommendations include enhancing family support, tailoring education initiatives, improving healthcare access, and providing support for older workers to ensure equitable resource distribution among retirees.

› The Influence of Psychosocial among Malaysian Retirement Readiness

This policy brief addresses the critical need for comprehensive retirement planning among Malaysians aged 45 to 60. The findings reveal a substantial gap in retirement preparedness, influenced by factors such as education, health status, income stability, social support networks and work environment quality. To mitigate these challenges, the brief proposes targeted policy interventions to enhance financial literacy, promote health and wellness, support income and employment, strengthen social networks, and improve work environments. Effective implementation requires collaborative stakeholder engagement, robust monitoring and evaluation mechanisms, adaptation to emerging trends, capacity building and targeted communication strategies.

OUTPUT

A policy brief entitled “**Enhancing Retirement Planning through Comprehensive Strategies**” was published by SWRC in 2024.

› Health Capacity to Work among Older Malaysians

This paper uses two methodologies to explore the extent to which greater labour force participation among older Malaysians can expand Malaysia's labour supply. The Milligan–Wise method estimates the potential to increase the labour force participation rate of older Malaysians by estimating how much they would work if they were to work as much as those with the same mortality rate in the past. The Cutler, Meara, and Richards-Shubik (2013) method estimates the same potential by estimating how much older Malaysians would work if they worked as much as their younger counterparts with similar health. We made further simulations to quantify the capacity of older Malaysians to work after they are 60 years old. The results show significant additional work capacity among older people in Malaysia, particularly males, urban dwellers and those with low educational attainment.

› Subjective Well-being among Older Malaysians

The rapid ageing of Malaysia's population is a critical social phenomenon that warrants an in depth investigation. Understanding the subjective well-being (SWB) of older persons is crucial for sound policymaking in ageing societies. The existing literature emphasises the importance of including noneconomic factors to understand one's wellbeing more holistically.

The current study uses data from the Malaysia Ageing and Retirement Survey to investigate their satisfaction with their lives using arrays of variables, including demographic, socioeconomic, living arrangements, social engagement and health. The analysis reveals that the SWB increases with age, especially among male older persons. The results show that the level of SWB is different for different living arrangements: living alone or with a spouse, living with a child and living with other family members as well as that the way various factors influence the SWB of older persons depends on their living arrangements. Specifically, the results suggest that older persons who are living independently experience higher SWB potentially because they have the capability to live without the support from their younger family members.

The findings of this study underscore the importance of catering to older persons with different levels of independence in terms of economic and health status to ensure the most effective and efficient support for older persons in Malaysia.

› The Psychological Distress, Coping Patterns and Social Support during COVID-19 Pandemic among Malaysian Older Adults

The coronavirus disease (COVID-19) pandemic poses a threat in which people with the most severe symptoms and the greatest risk of death are the elderly and those with chronic illness. During the COVID-19 pandemic, the world experienced a shutdown in daily activities where people are required to practice social distancing to reduce new infections. Isolation may have caused mental health deterioration among older adults.

This study examined the impact of the COVID-19 pandemic on the mental health of older Malaysians living in two urban states (Kuala Lumpur and Selangor) during the movement control order (MCO). The study was conducted on 274 older adults who participated in Malaysia Ageing and Retirement Survey (MARS) Wave 2 which was conducted between September 2020 and March 2022.

About 45% of respondents agreed that they felt alone during the MCO, while 59% stated that they felt sad due to no participation in social or religious activities which was higher among males compared to females. In terms of family relationships, about 53% stated that MCO did not strain their family relationship, while almost 60% were sad due to no physical meet-up with their family during the MCO. Only 37% stated that they felt anxious and stressed living in a confined space, the proportion was higher among the males. In a stressful situation such as the COVID-19 pandemic, it is crucial to pay attention to the mind of older people. Future public health initiatives should prioritise the development of timely and effective interventions to mitigate psychological distress among older adults during and following public health emergencies like the COVID-19 pandemic

› Study on Enhancing Social Assistance to Improve Fiscal Sustainability

Kajian Penambahbaikan Bantuan Sosial untuk Meningkatkan Kemampuan Fiskal

The Ministry of Finance (MOF), in collaboration with the Department of Statistics Malaysia (DOSM), the Implementation Coordination Unit (ICU) of the Prime Minister's Department (JPM), and the Social Wellbeing Research Centre (SWRC), Universiti Malaya, conducted a study focusing on improving the social assistance system to enhance fiscal sustainability. The sample of the project is obtained from the subset of MARS respondents.

The government's social protection interventions were delivered in various forms, including cash, goods, guarantees, and services, through programmes such as *Bantuan Sara Hidup* (Cost of Living Assistance), the School Supplementary Food Program (RMT) and others. The primary objective of the study was to provide policy intervention recommendations for implementing a more comprehensive and sustainable social protection policy to improve the wellbeing of the population.

› Simulation of Long-Term Care for Older Persons in Malaysia (MyLTC)

Malaysia is expected to be an ageing nation by 2030, resulting in a high demand for informal caregivers for older people. The caregiving burden can be significant and can impact the mental wellbeing of caregivers in the absence of sufficient support. This study aims to identify determinants of economically productive caregivers with sadness/depressive symptoms.

This study uses the Malaysia Ageing and Retirement Survey (MARS) Wave 1-2018/2019 data, focusing on economically productive individuals aged 40-60, providing care to parents and/or parents-in-law requiring care, either as primary caregiver or non-primary caregiver. We conducted binary logistic regression and included the following variables in our analysis: gender, age, marital status, education level, employment status, responsibility of care, presence of disease/illness, and perceived availability of help. The analysis was performed using SPSS 28 with sampling weight applied.

In total, 12.4% (n=414) of individuals aged 40-60 had parents or in-laws in need of care. Among them, 260 individuals (62.8%) reported experiencing sadness/depressive symptoms, ranging from rare to always, over the six months preceding the survey. After adjusting for other variables, the likelihood of experiencing sadness/depressive symptoms was higher among divorcee/widower, individuals with primary education level, homemaker, primary caregiver, with disease/illness and individuals who perceived help was available occasionally.

A high proportion of individuals who provided caregiving for their parents and/or parents-in-law experienced feelings of sadness or depressive symptoms, with a notably higher likelihood observed among primary caregivers. This highlights the importance of offering sufficient support to caregivers in the provision of aged care. Further research focusing on the specific challenges faced by these economically productive individuals is necessary to safeguard their wellbeing.

› The Impact of COVID-19 Pandemic on Individual Income, Expenditure and Savings Decisions

The COVID-19 pandemic changed the trajectory of the world, causing permanent changes to the world economy. Various studies have been conducted to identify the macroeconomic impact of COVID-19; however, little is known about how individual economic behaviour has been affected. Understanding the impact of the COVID-19 pandemic on individual income, expenditure and their saving decisions is crucial for economic recovery.

This research aims to examine the relationships between income, expenditure, and individual savings during the COVID-19 pandemic. While prior studies, particularly in developed countries have extensively examined the linkages between income, expenditure and household savings, the impact of this unforeseen pandemic on Malaysians' savings behaviour remains largely unexplored. Given the current economic challenges facing Malaysians, understanding these pandemic-induced shifts in savings decisions is crucial. In addition, this study seeks to identify the economic and psychological factors influencing the individuals' decision to save during this period.

The findings will enrich the literature on the socioeconomic impacts of income, expenditure, and savings decisions during the occurrence of the COVID-19 pandemic. The government as policymakers, financial planning professionals, as well as the general public, would be better informed about the factors that influence a person's savings in the pandemic era. This research is particularly important considering the issues of inadequacy in savings among Malaysians and possibly identifying the factors in improving the level of savings among these individuals.

This research will utilise data from the second wave of the Malaysia Ageing and Retirement Survey (MARS) conducted in 2021-2022 by the Social Wellbeing Research Centre (SWRC), Universiti Malaya. The survey consists of cross-sectional nationally representative household survey data sources that cover a large number of households across a few major cities in Malaysia. It captures the information that is needed for this study as the survey has been collected from Malaysians across a broad spectrum of socio-economic backgrounds. Based on these data, this study will conduct a series of empirical analyses on residents' wealth, income, and savings, which will enable us to examine the link between the COVID-19 pandemic and individual savings.

› Estimating Working Life Expectancy in Malaysia

Life expectancy at birth and at age 60 in Malaysia have been gradually increasing over the years. Adding life to years means filling the extra years of one's life with productive and meaningful activities. This paper estimated working life expectancy using two waves of longitudinal data from the Malaysia Ageing and Retirement Survey (MARS) involving adults aged 40 years and older. Status-based multistate life table methods were employed in generating the estimates for working life expectancy.

MARS baseline data 2018 - 2019 showed the prevalence of working declined from 25% among respondents aged 60-64 to only 5% among those aged 75 and older. The decline in prevalence of working among men and women were from 41.1% to 13.7% and from 10.8% to 0.6%, respectively. Examining status-based with the initial state working or not working revealed that for both males and females, life expectancy was slightly higher for those working compared to not working at ages 60, 70, and 80. Males consistently spent a higher proportion of their remaining life working than females at all ages, even though females have a longer life expectancy. This suggests that working keep older men and women active physically, mentally and socially and that lead to better health and well-being. The projected working life expectancy at age 60 indicated that extending retirement age to 65 lengthened the working life expectancy by 2 years from 5 years in 2020 to 7 years in 2040.

ABSTRACT

Throughout the world, people are living longer and ageing is accelerating. The World Health Organization (WHO) estimated that there will be 800 million older persons in the world by 2025 and 2 billion by 2050 with more than half of them living in developing countries. The Asia and Pacific Region is home to over a third of the world's older population, mostly in China. In 2016, approximately 12.4% of the region's population was 60 years or older, and it is projected to increase to more than 25% or 1.3 billion people by 2050 (See "Population and UN") (United Nations 2016). While the region is ageing more rapidly than any region in history, there are variations in the pattern and pace of ageing, ranging from aged richer countries to rapidly ageing middle income countries to younger and poorer countries (World Bank 2016).

Determinants Of Loneliness Among Mid-Aged And Older Adults

Norma Mansor, Halimah Awang, Tan Lih Yoong, Yamunah Devi Apalasamy & Nur Fakhrina Ab Rashid (2022)

International Journal for Studies on Children, Women, Elderly and Disabled, Vol. 15

ABSTRACT

Loneliness is a growing public health and societal concern, its prevalence being more common and at an elevated degree among older adults, imposing greater risk on cognitive function, psychosocial wellbeing, and quality of life. This study investigated the determinants of loneliness among mid-aged and older adults in Malaysia. Data were obtained from the Malaysia Ageing and Retirement Survey (MARS) conducted in 2018-2019, a nationally representative sample consisting of 5613 respondents aged 40 years and over. Loneliness was measured using a 5-point Likert scale on a single self-rated statement about how often the respondents feel lonely which was grouped into a dichotomous variable, often feel lonely and rarely or never feel lonely. About 32% of the respondents reported they often experienced loneliness. Chi-square tests were performed on the experience of loneliness across socio-economic and demographic characteristics, health conditions, family, and social connectedness, followed by logistic regression analysis incorporating these variables as possible predictors. The results showed that factors contributing to the likelihood of experiencing loneliness include being a female compared with male, ethnic Indian and other Bumiputera compared with Chinese, experience of feeling depressed and having diagnosed illnesses compared with respondents having no such experience and staying with other family members as opposed to living alone. In contrast, having a spouse, being more educated, being employed, having good self-reported health, good perceived family relationships and high social connectedness, and having young children living with the respondents were associated with significantly less likely to experience loneliness compared with their respective counterparts. The findings suggest the need for policies and strategies that would promote participation in the labour market, healthy living, strengthen family relationships and social connectedness. These factors are important considerations as the country is heading towards an aged population status.

INTRODUCTION

Loneliness has emerged as a growing public health and societal concern in recent years because of its impact on health and wellbeing, particularly affecting the ageing societies throughout the world. Although feelings of loneliness can occur at any phase in an individual's life, it is more common and at an elevated degree among older adults, imposing greater risk on cognitive function, physical and psychosocial wellbeing, and quality of life (Yong & Victor, 2011; Lee & Witten, 2014; Huang et al., 2021). With longer life expectancy, older individuals may experience life changes such as relocation, widowhood, and disability that are associated with increased vulnerability to loneliness and its prevalence hence increasing the burden of loneliness as well as its impact on them (Bail, 2006; Singh & Kumar, 2013). Without early and effective interventions, this could affect one's emotional and mental wellbeing as well as other health outcomes which can be costly (Stall, Savage & Roehrs, 2019; Huang, Chi, Kuo, Wu & Chang, 2021). Additionally loneliness was found to be one of the symptoms of psychological disorders such as depression

Factors Affecting Psychosocial Well-Being Of The Elderly In Malaysia

¹Social Wellbeing Research Centre, Universiti Malaya, Kuala Lumpur;
²Social Security Organisation, Kuala Lumpur, Malaysia

Abstract. Factors affecting psychosocial well-being of individuals ($n = 2,231$) ≥ 60 years of age (mean = 68 years) in Malaysia were identified using data from the Malaysia Ageing and Retirement Survey (2018-2019). Psychosocial well-being was measured using eight and nine statements on positive and negative outlooks on life respectively, with each statement scored on a 5-point Likert scale (score range = 17-85). Cronbach's alpha value was 0.851, indicative of high consistency. Composite psychosocial well-being indicator had a mean (SD) and median (95% confidence interval) score of 67.2 (9.9) and 68.0 (66.7-67.6) respectively. Significant factors associated with positive psychosocial well-being are rural residence; being married or never married, secondary or higher education level, good self-rated health, ability to perform activities of daily living, financial independence, and having monetary support, a loving family and caring friends. These findings should be considered in future initiatives to improve psychosocial well-being of the elderly in Malaysia.

INTRODUCTION

Rise in the number of elderlies and proportion of total population, largely due to declining fertility and mortality and increasing life expectancy, have raised concerns regarding their well-being (Christensen *et al.*, 2009; Doyle *et*

al., 2009; WHO, 2010; Read *et al.*, 2016). It is important to recognize that the well-being of an individual depends on professional and personal perspectives, life experience, engagement with family, occupation, and community type, all of which can lead to variations in the understanding of well-being of

Mental Accounting and Savings Behavior: Evidence From Machine Learning Method

Muhammad Aizat Alam, Yong Chen Chen & Norma Mansor (2023)

Journal of Financial Counseling and Planning, Vol. 34, Issue 2, July 2023

ABSTRACT

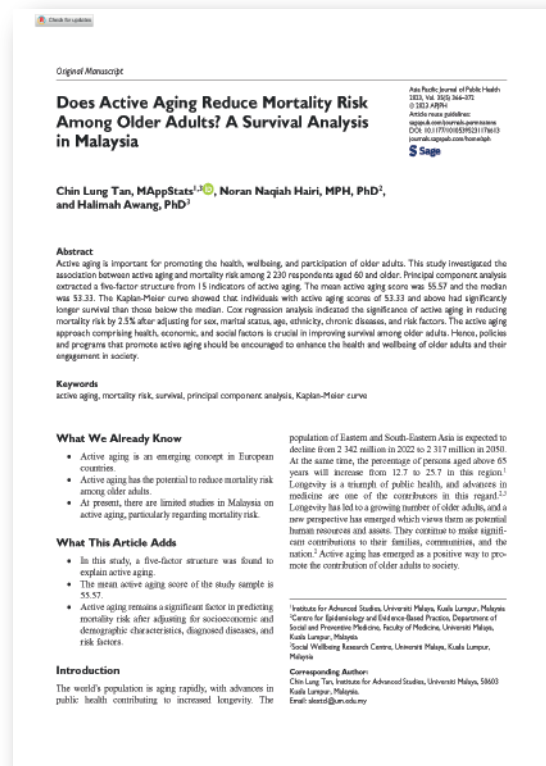

This article proposes a machine-learning-based method that can predict individuals' savings behaviour in the presence of mental accounting. The proposed predictive model perceives wealth and consumption as each being divided into three nonfungible distinct classes, as posited by the mental accounting theory. The predictive model found that mental accounting categories do have predictive power on savings behaviour where expenditure on discretionary items and current income are most important. Savings behaviour is best predicted by the random forest model based on the Malaysia Ageing and Retirement Survey data.

Does Active Aging Reduce Mortality Risk Among Older Adults? A Survival Analysis in Malaysia

Tan Chin Lung, Noran Naqiah Hairi & Halimah Awang (2023)
Asia Pacific Journal of Public Health, 35(5), 366-372.

ABSTRACT

Active ageing is important for promoting the health, wellbeing and participation of older adults. This study investigated the association between active ageing and mortality risk among 2,230 respondents aged 60 and older. Principal component analysis extracted a five-factor structure from 15 indicators of active ageing. The mean active ageing score was 55.57 and the median was 53.33. The Kaplan-Meier curve showed that individuals with active ageing scores of 53.33 and above had significantly longer survival than those below the median. Cox regression analysis indicated the significance of active ageing in reducing mortality risk by 2.5% after adjusting for sex, marital status, age, ethnicity, chronic diseases and risk factors. The active ageing approach comprising health, economic and social factors is crucial in improving survival among older adults. Hence, policies and programmes that promote active ageing should be encouraged to enhance the health and wellbeing of older adults and their engagement in society.

Factors Associated with Obesity and Abdominal Obesity Among Malaysian Older Adults

Yamunah Devi Apalasamy, Halimah Awang, Norma Mansor, Nur Fakhrina Ab Rashid, Nurul Diyana Kamarulzaman & Tan Lih Yoong (2021)

Asia Pacific Journal of Public Health, 33(5), 547-554.

ABSTRACT

Obesity is a rising concern globally. This study investigated the prevalence and factors associated with obesity and abdominal obesity (AO) among 5613 Malaysians aged 40 years and older via computer-assisted personal interviewing and anthropometric measurements. Obesity and AO prevalence were 37.8% and 63.1%, respectively. Significant associations were observed between: obesity with higher risk in patients aged between 40 and 49 years, odds ratio (OR) = 2.58 (95% confidence interval [CI] = 2.06-3.23); Indians, OR = 1.69 (95% CI = 1.34-2.12); females, OR = 1.64 (95% CI = 1.45-1.86); income \geq RM 2000, OR = 1.22 (95% CI = 1.05-1.43); and health status, OR = 0.74 (95% CI = 0.61-0.89); and AO with higher risk in patients aged between 50 and 59 years, OR = 1.39 (95% CI = 1.13-1.77); Indians, OR = 2.41 (95% CI = 1.87-3.12); females, OR = 1.28 (95% CI = 1.09-1.51); never married, OR = 0.47 (95% CI = 0.34-0.65); income \geq RM 2000, OR = 1.22 (95% CI = 1.03-1.43); and vigorous physical activity, OR = 1.27 (95% CI = 1.11-1.46). Hence, age, sex, income, and ethnicity are associated with both obesity and AO. Promoting healthy body mass index and waist circumference is essential for healthy ageing.

ABSTRACT

This paper proposes a machine-learning-based method that can predict individuals' savings adequacy in the presence of mental accounting. The proposed predictive model perceives wealth and consumption, each of which is being divided into three non-fungible distinct classes. The predictive model has found that the mental accounting categories have predictive power on savings adequacy, whereby the emphasis is that the expenditure on luxury items is followed by the total current asset. Savings adequacy is best predicted by the decision tree model based on the Malaysian Ageing and Retirement (MARS) survey data. Surprisingly, it was found that future income and necessities had a lower predictive power on savings adequacy. The findings suggest that individuals, financial professionals, and policymakers should be cognisant that higher likelihood of achieving savings adequacy can be achieved by focusing on accumulation of current asset while lowering expenditure on luxury items.

1. Introduction

The issue of savings adequacy has always been part of the ongoing discussion on social protection policies alongside coverage and the cost of social protection provision. Worldwide, countries are pushing towards eliminating poverty, and it remains imperative that ideal living standards are achieved within limited government fiscal capabilities. As such, the promotion of achieving adequacy should also come from fellow individuals where policies should be crafted towards encouraging individuals to save enough reserves to finance their consumption in later years. The inclusion of individuals should be part of the more sensitive conversation on protection against financial risks, prevention against reduced financial well-being levels, and promoting of good living standards for individuals.

Among the challenges, Malaysians also face an inadequate amount of financial capability to prepare against financial shocks such as job loss or rising illnesses. Moreover, most Malaysians are unaware of the benefits of subscribing to insurance policies. All this would naturally point to the weak level of capability of Malaysians to save.

While the savings rate among Malaysians has been historically on the low side (Bhazakh Research Institute, 2020), the COVID-19 pandemic

has brought new concerns given the contraction of global economic growth and the rising unemployment rate. The impact of COVID-19 on Malaysians is compounded with a finding in a recent survey by the Department of Statistics Malaysia (DOSM), where most working Malaysians have savings equivalent to less than 2-4 months' worth of their monthly salary (Cosin, 2020). This goes against the recommended rule of thumb by financial planners, which encourages an individual to have at least 3-6 months' worth of a monthly salary in preparation of emergency or financial shocks (Grogan & Delaney, 2018). This fact brings forth a more relevant need for policymakers to re-assess factors that contribute towards adequate savings for Malaysians.

Against this backdrop, the current paper proposes a machine-learning-based method to understand how different wealth and consumption categories are fitted under mental accounting has effect savings adequacy (i.e., among the individuals' saving decision-making), which relatively would be a more relevant objective considering the current economic challenges that are faced by Malaysians. While the relationships between income, expenditure and household savings have been shown, the influence of mental accounting is not clear from previous studies. A deeper look into how mental accounting influences savings adequacy is one of the key objectives in this study.

SUMMARY

Malaysia's rapidly ageing population has led to a significant increase in the number of older persons. This study aims to provide a comprehensive overview of the health, social, and economic circumstances of older persons in Malaysia. The study will provide useful input for policymaking and formulating a national framework for healthy and active ageing towards strengthening the social protection system. Internationally, MARS is one of the sister studies of the Health and Retirement Study (HRS) in the USA and part of a growing international network of longitudinal population studies on ageing.

Keywords: Ageing, population, study, older persons, Malaysia.

INTRODUCTION

Population ageing is a global phenomenon and Malaysia is not an exception. With an elderly population of 5.4 million in 2020, Malaysia is projected to have 7.4 million elderly persons by 2030. The projected increase in the elderly population is a significant challenge for the country. The projected increase in the elderly population is a significant challenge for the country. The projected increase in the elderly population is a significant challenge for the country.

In Malaysia, the elderly population is projected to increase from 5.4 million in 2020 to 7.4 million in 2030. This projected increase in the elderly population is a significant challenge for the country. The projected increase in the elderly population is a significant challenge for the country. The projected increase in the elderly population is a significant challenge for the country.

well as a significant challenge for the country.

METHODOLOGY

The first wave of MARS (MARS1) was completed in 2019. The second wave of MARS (MARS2) is currently in progress. The study will provide a comprehensive overview of the health, social, and economic circumstances of older persons in Malaysia.

MARS1 questionnaire was completed by 10,000 older persons in Malaysia. The questionnaire covers a wide range of topics, including health, social, and economic circumstances. The study will provide a comprehensive overview of the health, social, and economic circumstances of older persons in Malaysia.

ABSTRACT

Malaysia Ageing and Retirement Survey (MARS) is a nationwide longitudinal study on ageing and retirement that offers comprehensive micro-level data on older Malaysians' health, social situations and economic circumstances. MARS will provide useful input for policymaking and formulating a national framework for healthy and active ageing towards strengthening the social protection system. Internationally, MARS is one of the sister studies of the Health and Retirement Study (HRS) in the USA and part of a growing international network of longitudinal population studies on ageing. MARS enables investigation of variations that influence individual ageing, health and retirement behaviours and outcomes.

Preparedness to Age in Place Among Older Adults in Malaysia

Halimah Awang, Tan Chin Lung, Nur Fakhрина Ab Rashid, Norma Mansor, Tan Lih Yoong & Kama Firdaus Subbahi (2024)

Ageing International, 1-16.

ABSTRACT

The rapid pace of ageing raises concerns regarding financial security, health and long-term care and place for older people to live as they age. This paper examined the factors associated with preference to age in place (AIP) among 2231 respondents aged 60 and older from the Malaysia Ageing and Retirement Survey (MARS). The Categorical Principal Component Analysis (CATPCA) was utilised to identify variables that represent family supports, social connectedness and social participation. 75% of the respondents indicated that they would like to age in place with the binary logistic regression showing a greater likelihood among respondents with strong family and social connectedness, having a spouse, being non-Chinese and being in a good health condition. Urban respondents, with a high individual capacity and social participation, are less likely to age in place. There is a need to strengthen the family institutions and communities, providing incentives and support to promote ageing in place and empower them to remain sustainable for future generations.

Health Capacity to Work Among Older Malaysians

Asian Development Review, 41(01), 147-168.

Health Capacity to Work among Older Malaysians

NORMA MANSOR , HALIMAH AWANG , AND
DONGHYUN PARK 

This paper uses two methodologies to explore the extent to which greater labor force participation among older Malaysians can expand Malaysia's labor supply. The Milligan–Wise method estimates the potential to increase the labor force participation rate of older Malaysians by estimating how much they would work if they were to work as much as those with the same mortality rate in the past. The Cutler, Meera, and Richards–Shubik (2013) method estimates the same potential by estimating how much older Malaysians would work if they worked as much as their younger counterparts in similar health. We made further simulations to quantify the capacity of older Malaysians to work after they are 60 years old. The results show significant additional work capacity among older people in Malaysia, particularly males, urban dwellers, and those with low educational attainment.

Cognitive Functioning among Older Adults in Japan and Other Selected Asian Countries: In Search of a Better Way to Remeasure Population Aging

Naohiro Ogawa, Taiyo Fukai, Norma Mansor & Nurul Diyana Kamarulzaman (2022)

Asian Development Review, Vol. 39, No. 1, pp. 91–130

ABSTRACT

Japan is the oldest society in the world. It has the highest proportion of the population aged 65 and over, a demographic indicator that has been used by demographers for more than a century. One of the main objectives of this study is to apply a new indicator—the cognition-adjusted dependency ratio (CADR)—to remeasure the level of population ageing from an innovative point of view. To compute this new index, we apply the mean age-group-specific immediate recall scores for Japan and four other Asian countries and we compare the results with those derived from the United States and various developed nations in Europe. Our analysis shows that Japan's pattern and level of age-related decline in cognitive functioning are highly comparable to those of many other developed nations, particularly in Continental Europe. Among the other Asian countries, Malaysia shows a pattern of change similar to countries in Southern Europe, although Malaysia has slightly lower scores than Southern Europe in all age groups. More importantly, these comparative results based on CADR are astonishingly different from the corresponding results obtained from conventional old-age dependency ratios. The Japanese case is the most salient example.

Examining Intergenerational Transfers in Malaysia

Halimah Awang, Muhammad Amirul Ashraf Abd Ghani & Norma Mansor (2024)

International Journal of Population Studies

ABSTRACT

With the demographic changes toward the ageing population, the role of intergenerational support and transfers has become increasingly prominent in the family support network. Using the Malaysia Ageing and Retirement Survey Wave 1 conducted in 2018/2019, this study analysed the flow and factors associated with the amount of intergenerational financial transfers across three generations via multiple regression analysis. The results showed an upstream flow of financial support from younger to older generations. Variables with significant capability in determining the amount of intergenerational financial transfers include age, gender, ethnicity, education level, marital status, employment, health status, number of living children or parents, income and financial assistance received from the government. Findings from this study are useful for policymakers to understand the issues of old-age financial security in Malaysia and thus implement relevant policies such as improving the coverage and adequacy of existing social protection programmes, strengthening family support networks, as well as educating the public on the importance of having sound financial knowledge.

Training Programmes

1. Conducted by Survey Research Center (SRC), Institute for Social Research (ISR), University of Michigan

The Social Wellbeing Research Centre (SWRC) inked a MoU with Survey Research Center, Regents of the University of Michigan in March 2018. The collaboration has enabled SWRC's researchers to participate in several workshop and training with the Survey Research Center (SRC), Institute for Social Research (ISR), University of Michigan.

MARS Training Workshop 27-30 November 2017

MARS Training Workshop was led by the Survey Research Center (SRC), University of Michigan, USA. The training was held at the Social Wellbeing Research Centre (SWRC) between 27-30 November 2017. The main objective of the training workshop is to assist SWRC in preparing for MARS.

HRS Training Observations Personnel Technical Training

7-14 April & 16-20 April 2018

In order to prepare MARS for large scale data collection for longitudinal study and the usage of computer-assisted interviewing MARS team members were invited to attend the Health and Retirement Study (HRS) interviewer training on 7 – 14 April, 2018 in Detroit, Michigan and computer personnel technical training in Ann Arbor, Michigan, USA, from 16 – 20 April, 2018. The training programme was attended by SWRC's Principal Research Fellow, Halimah Awang and SWRC's Research Officers, Nur Fakhрина Ab Rashid and Tan Lih Yoong.

Health and Retirement Study 2024, April 2024 Interviewer Training 23-29 April 2024

Health and Retirement Study 2024 Interviewer Training was held from 23-29 April 2024, in Michigan, USA. This training programme was organised by the National Institute on Aging (NIA) and the Institute for Social Research (ISR) at the University of Michigan. Attendees included Yong Zulina Zubairi (SWRC Senior Research Fellow), Yamunahh Devi Apalasamy (SWRC Social Research Officer), and Kama Firdaus Subbahi (SWRC Social Research Officer).

2. Conducted by the Social Wellbeing Research Centre (SWRC) to train MARS enumerators

MARS CAPI Training Workshop 24-27 July 2018

To ensure survey readiness, SWRC recruited and provided comprehensive training sessions for over 100 enumerators from across Malaysia for MARS Wave 1 survey. The initial training in July 2018, was conducted in collaboration with technical experts from the Survey Research Center, University of Michigan. Subsequent trainings were conducted in smaller batches for enhanced focus and individualised support. On-site coaching was provided to assist enumerators who encountered challenges during fieldwork. During these training sessions, field interviewers received comprehensive instruction on utilising and managing the computer-assisted personal interviewing (CAPI) system.

MARS Wave-2 Production Training 16–18 March 2021

Over 60 enumerators, including returning interviewers from MARS Wave 1 and new candidates, were trained from across Malaysia during the MARS Wave 2 period. Each potential interviewer underwent a rigorous selection process involving assessments and interviews. During training, candidates received comprehensive instruction on using various instruments for physical measurements, including blood pressure, handgrip strength, height, hip circumference, waist circumference and weight. Following successful completion of the final assessment, candidates were offered positions as field interviewers. Due to the COVID-19 pandemic, several subsequent training sessions were conducted virtually.

A crying need for a Department of Ageing to take care of our elderly

By LILY FU

FAMILY

Wednesday, 12 Apr 2023 6:00 PM MYT

Unless we have prepared well, the years after retirement can be far from golden. — 123rf.com

Working folks envy their colleagues who have retired. No more nine to five, no more taking orders from the boss, no more stress from meeting deadlines or worrying about ROI.

They have all the time now to do what they like, go where they want and be able to finally put their dreams, whether it's to travel, take up a new hobby or get a degree.

A Crying Need for a Department of Ageing to Take Care of Our Elderly

written by Lily Fu, as featured in The Star on 12 April 2023

“

Based on findings of the ongoing Malaysia Ageing and Retirement Survey (MARS) conducted by Universiti Malaya's Social Wellbeing Research Centre, and involving 5,613 respondents, Malaysia will be classified as a super-aged nation by 2056 when 20% of the population is aged 65 and above.

Academicians and researchers on ageing have conducted countless surveys over the years. It is such a waste of time, money and effort when nothing much happens after they have presented their findings to the government.

The proposal to introduce legislations against elder abuse and abandonment has been brought up now and then over the past two decades. Each time the issue raises a storm of controversy, then it buzzes out till the next time it is mentioned again in Parliament.

”

Poverty after retirement?

By Sharen Kaur - January 1, 2024 @ 10:00am

Will Malaysia soon face a retirement crisis, given that almost 40 per cent of its citizens do not have a retirement plan?

KUALA LUMPUR: Will Malaysia soon face a retirement crisis, given that almost 40 per cent of its citizens do not have a retirement plan?

Only 4.0 per cent of Malaysians could afford retirement, according to the Employees Provident Fund (EPF) calculations from the previous year.

Increased expense of living in today's world and withdrawals of substantial portion of their savings from the EPF during the pandemic had caused some members to experience poverty even before they can retire, a market insider said.

"This is today's harsh reality. It's not just a matter of depleted funds now for those who took withdrawals from their EPF accounts during the pandemic. The interest that their accounts would have paid from the profits of their EPF investments represents an opportunity cost," the observer added.

EPF members have received an average annual return of about 4 per cent since 2011.

The return on a RM100,000 EPF account would be RM4,000, and it would rise annually. However, the interest rate in RM400 annually if you currently only have RM10,000 as a result of the different withdrawals you made.

"Rebuilding the EPF account's wealth will take time," the insider told Business Times.

To lessen the effects of the pandemic, 8.1 million Malaysians withdrew RM1.45 billion from the pension fund over the course of four rounds of Covid-19 withdrawals between 2020 and last year.

As early as February 2021, the EPF reported that about 30 per cent of members had nearly depleted their retirement funds in Account 1, which is typically not withdrawable before age 55.

About 6.7 million members under the age of 55 had less than RM10,000 in their accounts at the end of 2022, accounting for 51.5 per cent of all members.

According to statistics, 35 per cent or 94,827 of 274,715 EPF members aged 54 years, have less than RM10,000 in savings, while only 2.0 per cent or 4,877 members from the same age group, have over RM1 million.

"I think one solution to the low retirement savings crisis is to raise the retirement age from 60 to 65 years old. The government ought to consider providing a safety net to people who don't have a stable enough retirement fund. Malaysia ought to follow other nations' lead," the industry insider said.

In Thailand, all citizens over 60 receive a monthly allowance of 600 baht (RM79.26), unless they work for the government. Every 10 years, recipients will receive an additional 100 baht a month until their allowance reaches 1,000 baht (RM132.10).

Poverty after Retirement?

written by Sharen Kaur, as featured in NST on 1 January 2024

“

Based on Malaysia Ageing and Retirement Survey (MARS) Wave 2, some 37 per cent of the 4,821 respondents said they had not given much thought towards retirement while 23 per cent said they may opt to change the nature of their work. At least 21 per cent of respondents said they would continue to work until their health failed, while only 10.8 per cent of interviewees said they would stop work altogether.

Also, 71 per cent of respondents who rarely or never think about retirement had no schooling or only had a kindergarten education, while 76 per cent had religious or primary education. The trend was opposite among respondents with increasing education levels. Furthermore, among respondents aged 60 and above, 26 per cent said they would work as long as their health held out. The study was conducted by the EPF-endowed Social Wellbeing Research Centre (SWRC) of Universiti Malaya. Respondents comprised three age groups; 40-49, 50-59, and 60 years and older. Data was collected from October 2020 to April 2022, involving face-to-face interviews with individuals aged 40 years and older residing in all states of the peninsula, as well as Sabah and Sarawak.

'Super-aged' Malaysia by 2056: What we need to do

By [Norma Mansor](#) January 25, 2021 @ 12:00pm

Up to last year, more than seven per cent of Malaysia's population were 65 and above, making the country an "ageing nation". - NSTP/ACHMAD SHAHRIL BAKRI SAGI

MANKIND is growing in numbers and age. By 2030, there will be eight billion of us, with one billion above age 65.

The enhancements in medicine and technology will continue to hack the code of life so that we're not only living longer, but better.

Malaysia is not exempted from these growing trends. Up to last year, more than seven per cent of Malaysia's population were 65 and above, making the country an "ageing nation".

At the current trajectory, those 65 and above are projected to double to 14 per cent by 2044 (aged nation) and to 20 per cent by 2056, thus classifying Malaysia as a "super-aged" nation. At this rate, Malaysia will transform from an ageing nation to an aged nation in just under 25 years.

To put this into context, it took France 115 years, Sweden, 85 years and the United Kingdom, 45 years to achieve a similar scenario.

The major difference is that these countries had adequate time to develop and prepare by increasing per capita efficiency and gradually raising the retirement age as they made the ascent to a super-aged nation.

The Malaysia Ageing and Retirement Survey (MARS) is an ongoing study conducted by Universiti Malaya's Social Wellbeing Research Centre. Launched in 2018, MARS aims to produce a comprehensive longitudinal study on ageing by collecting various aspects of personal life and experiences of people aged 40 years and older.

Today, the database consists of 5,613 respondents, comparable to other international family surveys such as the Health and Retirement Survey in the United States and Survey of Health, Ageing and Retirement Europe.

Key findings include: ACTIVE transfers in both directions: 42 per cent of respondents gave financial support to their children, while 48 per cent of them received support from their children. The monthly median amount is RM100 and RM150, respectively.

The study also shows that more respondents received financial support as age increases; FAMILY bonds still preferred. More than half believe that they would need long-term care beyond age 65, and over 80 per cent agree that it should be mandatory by law for children to look after their older parents; RISING health costs anticipated in old age.

Hypertension tops the list of doctor-diagnosed diseases (37 per cent) followed by high cholesterol (21 per cent) and diabetes (19 per cent).

However, among respondents not diagnosed with hypertension, 44 per cent were in the category of hypertension based on tests taken during the field interview; LARGE dependence on public healthcare facilities.

The majority of respondents use government facilities for outpatient treatment, medical check-up and hospitalisation, with only a small proportion having private health insurance; and, INSUFFICIENT savings for retirement.

Four in 10 respondents are dependent on cost-of-living allowances/subsidies given by the government. Although the majority have savings and assets, the total value was low and insufficient.

'Super-aged' Malaysia by 2056: What We Need to Do

written by Norma Mansor, as featured in *The Star* on 25 January 2021

“
The Malaysia Ageing and Retirement Survey (MARS) is an ongoing study conducted by Universiti Malaya's Social Wellbeing Research Centre. Launched in 2018, MARS aims to produce a comprehensive longitudinal study on ageing by collecting various aspects of personal life and experiences of people aged 40 years and older. Today, the database consists of 5,613 respondents, comparable to other international family surveys such as the Health and Retirement Survey in the United States and Survey of Health, Ageing and Retirement Europe.
It is the hope that the MARS study will provide data that can be used by researchers, ministries and agencies to propose forward looking policies for an ageing Malaysia.”

Interview with Professor Datuk Dr. Norma Mansor, Director of the Social Wellbeing Research Centre at Universiti Malaya, former Secretary of the National Economic Advisory Council of Malaysia

Pursuing Well-Being in Asia with Knowledge of Aging

By Japan SPOTLIGHT

An aging society is not necessarily a threat to the economy. Depending on relevant policies, it could add benefits to the economy. We could take full advantage of such benefits or get to know how to minimize their costs through an international mutual learning process with evidence-based information.

Dr. Norma Mansor is one of the most distinguished experts on this issue with her experience of working for some prestigious international organizations such as the UNDP, ILO, OECD and ADB. Our interview with her follows.

(Interviewed on Sept. 7, 2023)

Her Working Experience on Aging Societies

JS: You are one of the world's experts when it comes to aging societies. Could you talk about your work related to aging societies with various international organizations?

Mansor: My work on aging started two decades ago when I began looking at social security issues among older persons in Asia, especially post-retirement. The OECD commissioned this study and it highlighted the gaps in income security, especially among older Malaysians. I continue to study this area with some other work funded by our local university and the Malaysian government, but the more intense work on aging was when I joined the Social Security Research Centre.

This center was established specifically to look at income and old-age financial protection. The main task was to advance research on aging and social protection. The Malaysia Employees Provident Fund (EPF) is the provider of the endowment for the financing of the center, and the interest is to see whether the savings – the employees provident fund – is sufficient for the people's needs after retirement. That is when we got more involved in the work on aging, as we felt that there were inadequate studies, data and information on aging. The center seeks to have an inventory of work related to aging and that is when we embarked on the Malaysia Aging and Retirement Survey which is a longitudinal study and is nationally representative. That is one of our efforts to fill in the gap for evidence-based policymaking.

Dr. Norma Mansor

JS: You mentioned work for international organizations such as the OECD and ADB, and have already answered my second question regarding the center. Aging used to be considered a domestic issue but now seems to be a global issue. When do you think this issue became global in nature?

Mansor: Well, the aging population has mainly happened in developed countries but for the past decade I would say developing nations have started to experience it. In Asia, for example, it started with Japan and then China, South Korea, and then Singapore. This made us feel that we had to focus on aging and we

had to share experiences between different countries in order for us to learn from each other. The demographic transition or demographic shift where older people form a larger portion of the population is becoming a problem not just among the advanced countries but also among the developing nations. So that's when aging research started to come to the front of the research focus.

JS: According to your explanation of your career, I thought that you started your academic career as a sort of microeconomist because you focused on social security policy. However, aging is now a macro policy issue, so I guess perhaps the aging issue has become a macro policy issue, and then it becomes a global issue because macro policy must have international repercussions for the global economy.

Pursuing Well-Being in Asia with Knowledge of Aging

an interview article with MARS Principal Investigator, Norma Mansor as featured in the Japan SPOTLIGHT on December 2023

“

An aging society is not necessarily a threat to the economy. Depending on relevant policies, it could add benefits to the economy. We could take full advantage of such benefits or get to know how to minimise their costs through an international mutual learning process with evidence-based information.

”

TV3 Malaysia Hari Ini (MHI): The Malaysia Ageing and Retirement Survey (MARS)

as featured in TV3 on 21 January 2021

SWRC's Principal Research Fellow, Halimah Awang was interviewed by Malaysia Hari Ini (MHI) TV3 on 21 January 2021 to share some key findings from the Malaysia Ageing and Retirement Survey Wave 1.

UMPodcares: Ageing and Social Protection

as featured in UMPodcares by Universiti Malaya Community Engagement Centre (UM Cares) on 28 November 2023

SWRC's Principal Research Fellow, Halimah Awang appeared in an episode of podcast by Universiti Malaya Community Engagement Centre (UM Cares) on 28 November 2023. The session, titled "Ageing and Social Protection," highlighted some of the critical issues surrounding the ageing population and the urgent need for comprehensive social protection policies.

In the podcast, Halimah Awang shared key insights from MARS. She highlighted some of the pressing challenges faced by older adults in Malaysia, including financial insecurity, access to quality healthcare, housing needs and social inclusion. Halimah emphasised the implications of Malaysia's rapidly ageing population, urging stakeholders to implement policies that ensure the dignity, security and wellbeing of older adults.

Moving Forward

The Malaysia Ageing and Retirement Survey (MARS) represents a groundbreaking effort in understanding the dynamics of ageing and retirement in Malaysia. Since its inception in 2018, MARS has established itself as a vital resource for longitudinal data, capturing the multifaceted lives of middle-aged and older Malaysians. With two waves completed, the initiative has documented various aspects of ageing, including socio-economic, health, income, employment and psychological, creating a robust foundation for policy formulation and global collaboration.

This journey has been one of resilience and innovation. Despite challenges such as the COVID-19 pandemic, the MARS team has managed to adapt to ensure the integrity and continuity of its research. Strategic partnerships with international organisations such as the University of Michigan, Asian Development Bank (ADB), World Health Organization (WHO) and others have elevated MARS to a global platform, enabling comparative analyses and enriching Malaysia's contributions to international ageing studies.

Looking ahead to MARS Wave 3, preparations are already underway to build on this legacy. The next wave promises to integrate enhanced methodologies, expand datasets and introduce new modules to address emerging issues in ageing. Emphasis will be placed on fostering active and healthy ageing, refining social protection mechanisms and exploring innovative policy solutions to support Malaysia's ageing population.

The success of MARS lies in its commitment to inclusivity, evidence-based policymaking and its dedication to improving the quality of life for older Malaysians. As we move forward, MARS remains poised to lead the conversation on ageing, providing insights that will shape Malaysia's journey into becoming a super-aged society in the next few decades.
